

# Optimising $\text{TiO}_2$ in Coatings systems and

## **Introducing FP-440**

The Next Generation in  
FP-Opacity Pigments™ Technology

**FP-Pigments** are a global manufacturer of opacity pigments and speciality minerals for the coatings, plastics, paper and printing ink markets.

Our innovative, patented products enable the coatings producer to make significant raw material savings while maintaining or improving coating properties.

# Importance of Refractive Index

For a coating to be opaque (and white) it needs to be able to bend and scatter light before it reaches the substrate.

The bending of light is governed by the refractive index of the various materials in the coating and the differences between them.

For the highest opacity and tint reducing power there is **no** alternative to  $\text{TiO}_2$  - this is true especially for wet opacity.

Replacing  $\text{TiO}_2$  with Extenders will reduce wet hide and tint strength and will maintain dry opacity only through secondary properties – high medium demand, reduced crowding etc.

# Importance of “Spacing” $\text{TiO}_2$

## Inter-particle distance

Less than 1 particle apart

**LESS THAN 1 PARTICLE APART**

Inefficient scatter as light cannot differentiate between the two particles.

1 particle apart

**1 PARTICLE APART**

Efficient scatter as light can differentiate between the two particles.

more than 1 particle

**MORE THAN 1 PARTICLE APART**

Inefficient scatter as light can pass between the two particles uninfluenced.

# TiO<sub>2</sub> Crowding in matt paint films

Cheap, coarse fillers

5µm Extender

More Expensive, fine extenders

0.8µm Extender

Pigment crowding reduces as Extender particle size decreases

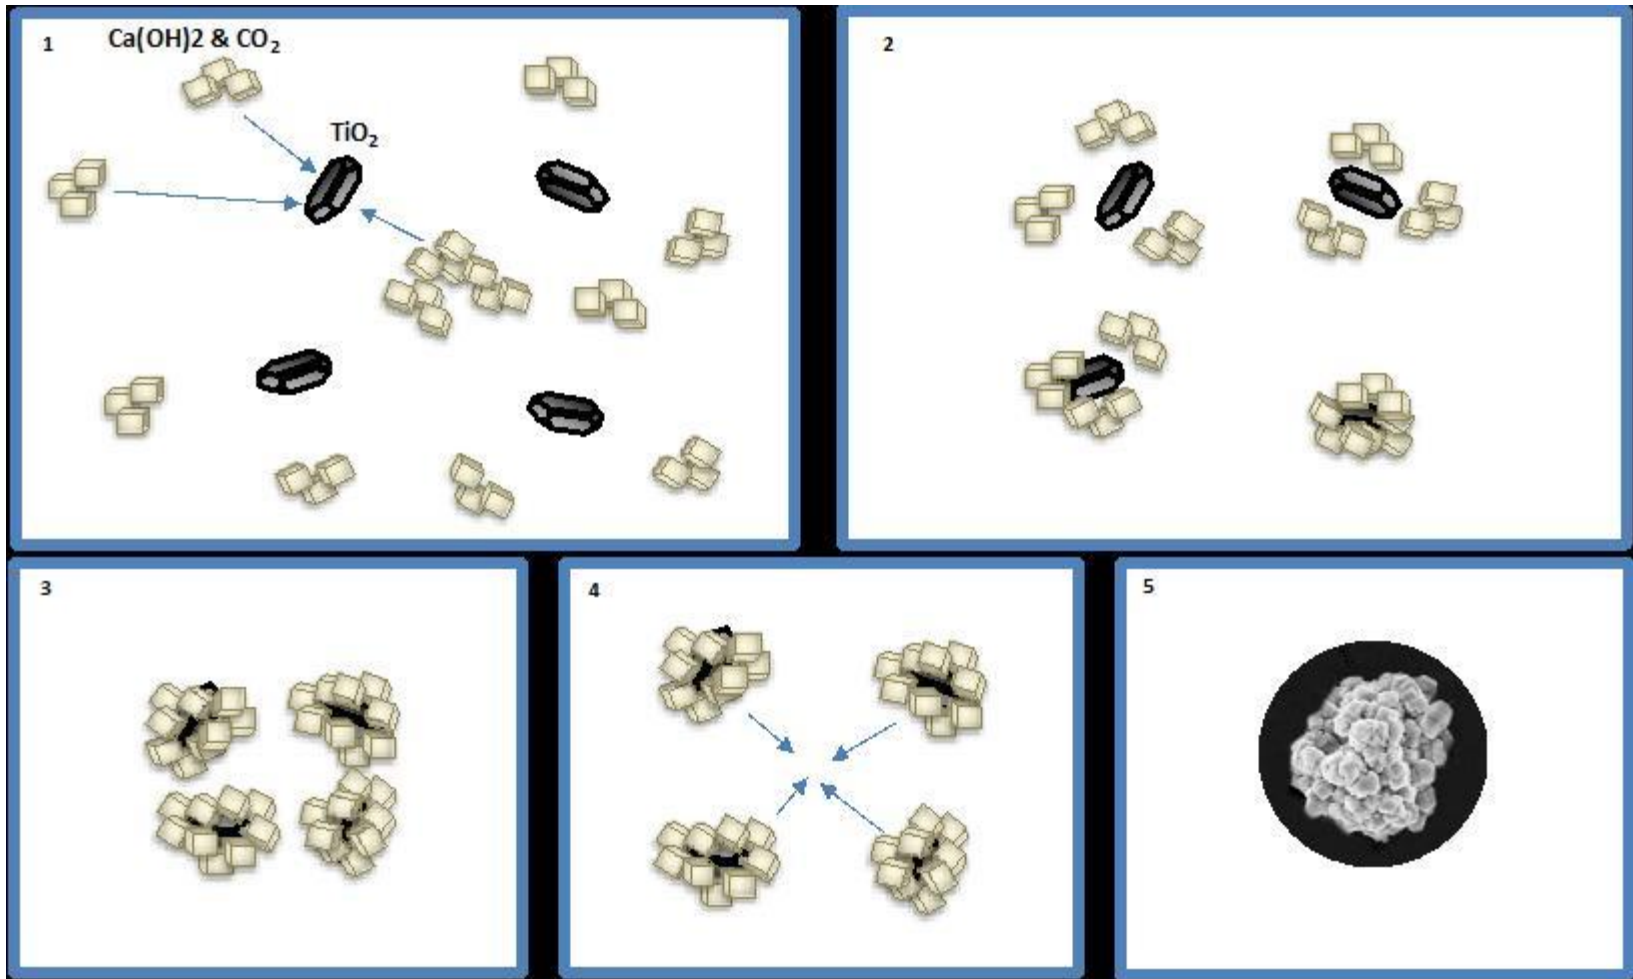

FP-Pigments produce composite pigmentary products for the paints, plastics, inks and paper industries

- These composite pigments are designed to provide significant improvements in the optical properties of coatings whilst maintaining other coating requirements

# FP-Pigments – New Development FP-440

It is well understood that the difference in refractive index is a major influence on light scatter.

High PVC Paints rely on it.

The optimum difference that can realistically be achieved is between Rutile TiO<sub>2</sub> and Air.

FP-Pigments R&D looked to combine our proprietary and original particle spacing technology with the management of air inclusions inside our stable manufactured FP-Pigments particle.

A new product was thus launched in 2020.

In 2020, FP-Pigments introduced some new process changes which have enabled us to make particles with an improved uniform size and which contained additional entrapped air alongside the optimally spaced  $\text{TiO}_2$ . Together, these improvements have further enhanced the scatter per unit  $\text{TiO}_2$  employed.

Original  
Opacity Pigment™

Next Generation  
Opacity Pigment™

FP-440 is one of the first products of this next generation family of FP-Opacity Pigments™ - specifically designed to enhance the amount of air and the air/ $\text{TiO}_2$  ratio in the particle to produce the optimum light scatter for the minimum  $\text{TiO}_2$  used.

# Effect of incorporated air on Scatter

FP-440 is thus designed to give the same level of performance as FP-460 in High PVC Paints, Powder Coatings and certain plastics applications. All at a lower  $\text{TiO}_2$  level and hence lower cost

# European High Quality Interior Matt

PVC	TiO <sub>2</sub> wt%	Extenders used
68%	10%	GCC, Calcined Clay

10%-15% replacement of TiO<sub>2</sub> gives similar dry opacity at an estimated cost saving of ~0.02-0.03 Euro/L

	CR 10% <sub>R</sub>	CR 15% <sub>R</sub>	WH 10% <sub>R</sub>	WH 15% <sub>R</sub>
Std	95.4	95.4	47.4	47.4
FP-440	95.3	95.1	47.1	46.9

# Typical DIY Matt Product

PVC	TiO <sub>2</sub> wt%	Extenders used
79.6%	5	GCC, Calcined Clay, Kaolin

Dry Opacity

10% and 15% replacement of TiO<sub>2</sub> gives similar dry opacity an estimated cost saving of 0.01-0.02 Euro/L

	CR 10% <sub>R</sub>	CR 15% <sub>R</sub>	WH 10% <sub>R</sub>	WH 15% <sub>R</sub>
Std	95.1	95.1	46.4	46.4
FP-440	95.0	94.9	46.0	45.9

# Distemper/Economy Paint

PVC	TiO <sub>2</sub> wt%	Extenders used
92.9%	0.5	GCC, Calcined Clay, Kaolin, Talc

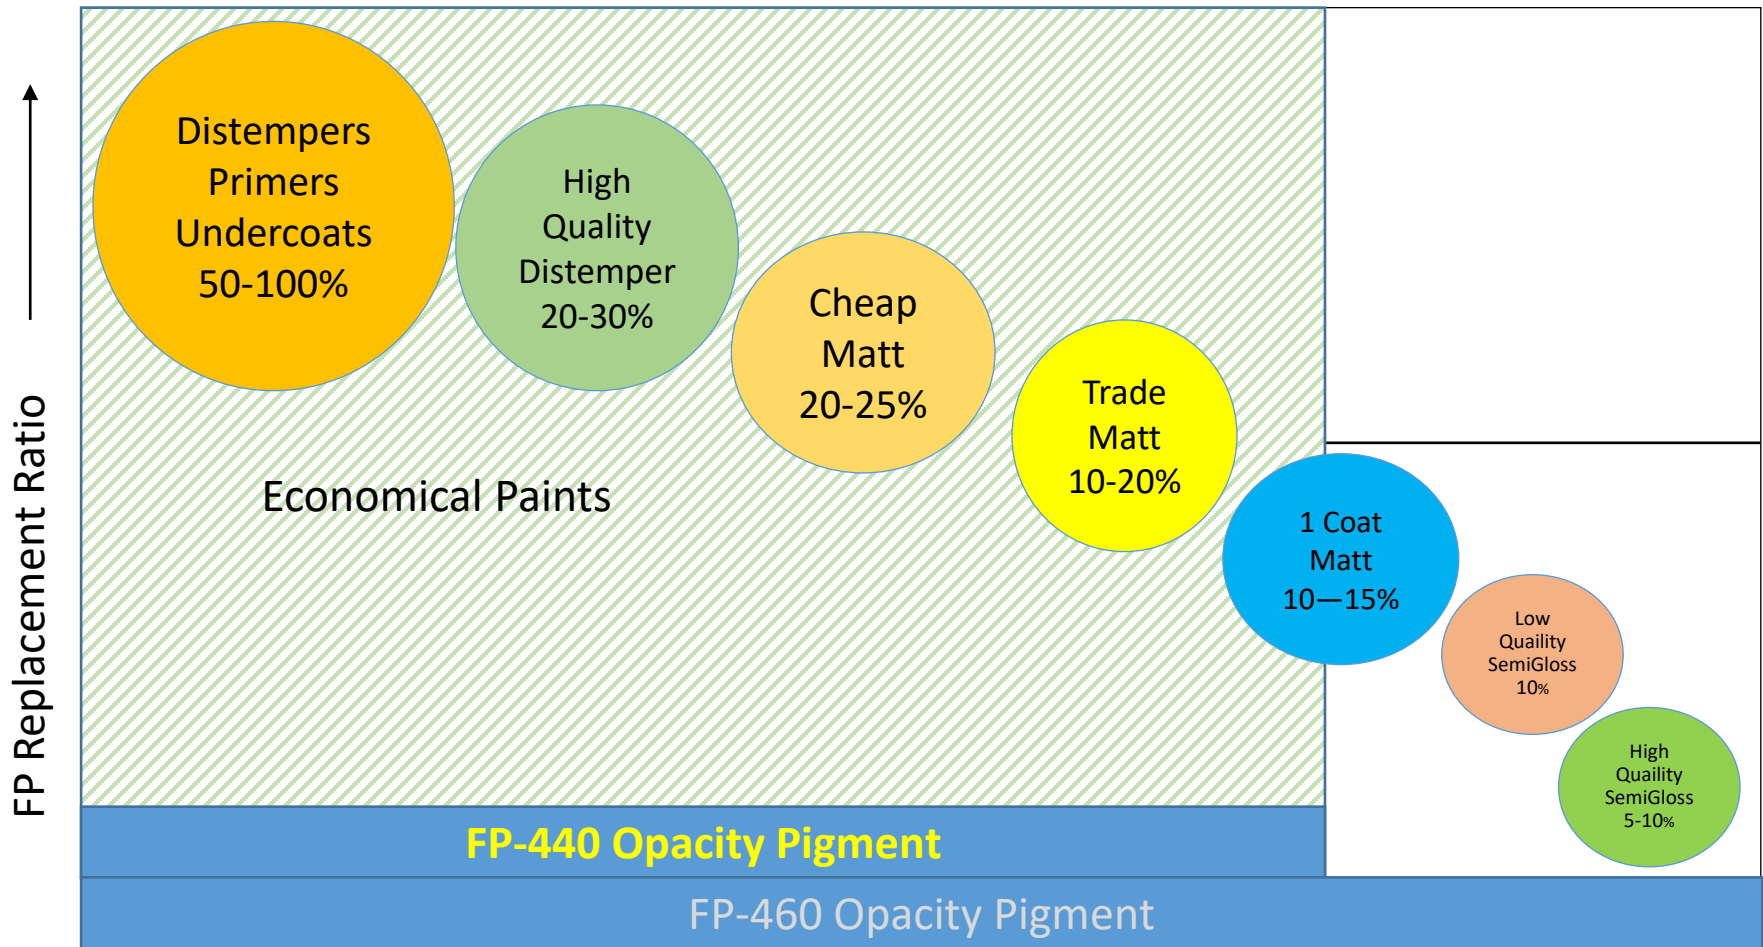

## Dry Opacity

25% and 50% replacement of TiO<sub>2</sub> gives similar dry opacity an estimated cost saving of 0.06-0.07 Euro/L

	CR 25% <sub>R</sub>	CR 50% <sub>R</sub>	WH 25% <sub>R</sub>	WH 50% <sub>R</sub>
Std	98.0	98.0	36.3	36.3
FP-440	98.0	98.0	36.6	36.4

# FP replacement ratios across a range of formulations

# Powder Coatings - Opacity

The use of FP-Pigment in powder coatings initially improves the opacity. 10-20% replacement is possible before the opacity starts to reduce.

# Cost Advantage of Using FP-Opacity Pigment™

Titanium Dioxide price varies over time, often increasing very rapidly. FP-440 Opacity Pigment™, whilst providing equivalent performance in these formulations, is almost immune to these market fluctuations. The potential savings will depend on the TiO<sub>2</sub> replacement ratio achieved.

- The carbon footprint , cradle to gate, was externally assessed in accordance with the LCA Standards ISO 14040 and ISO 14044.
- Using figures for the carbon footprint of titanium dioxide published by the Titanium Dioxide Manufacturers Association together with figures from the Ecoinvent database, we have calculated the level of carbon dioxide released when manufacturing FP-Pigments Opacity Pigment.

**Carbon Dioxide Emissions  
for  
FP-440 Opacity Pigment™  
are  
1.6 t CO<sub>2</sub> / t of FP-440**

**A 67% Reduction in Carbon Footprint  
compared to a tonne of TiO<sub>2</sub>**

## FP-Pigment in various coatings applications.

- ✓ No compromise on Opacity and Whiteness
- ✓ Significantly Lower cost across the  $\text{TiO}_2$  price cycle.
- ✓ Improved output for the same amount of  $\text{TiO}_2$
- ✓ Lower Carbon Footprint

**Thank You!**
